Neurosci. Res. 49:319-332(1997).

1. Neurosci. Res. 49:319-332(1997).

2. FUNGTION: The function of brain MAPS is essentially unknown. Prosphorylated MAPLB may play a role in the cytoskeletal changes that accompany neurite extension. Possibly MAPLB Binds to at least two tubulin subunits in the polymer, and this bridging of subunits might be involved in nucleating microtubules.

2. SUBUNIT: 3 different light chains, LCI, LC2 and LC3, can associate with MAPLB and MAPLB proteins.

3. WITH MAPLA and MAPLB proteins.

4. TISSUE SPECIFICITY: Nervous system (spinal cord, brain stem, cerebellum and cerebrum). Not expressed in liver, spleen, kidney,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       heart or muscle.

DEVELOPMENTAL STAGE: In cerebral cortex, spinal cord and sciatic nerve levels are high early in development but decrease during postnatal development and are low in adults. In dorsal root ganglia levels remain high throughout development.

INDUCTION: By nerve growth factor.

DOWAIN: Has a highly basic region with many copies of the sequence KKEE and KKEI/V, repeated but not at fixed intervals, which is responsible for the binding of MAPIB to microtubules.

FTW. LCI is coexpressed with MAPIB. It is a polypeptide generated from MAPIB by proteolytic processing. It is free to associate with of MAPIB (By similarity).

STHWAY: Peptidogalycan synthesis; final stages.

SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN, PROBABLY FOUND ALL OVER THE WHOLE CELL AT LOW CONCENTRATIONS. ALSO LOCALIZES TO THE DIVISION SITE IN VEGETATIVE CELLS.

DEVELOPMENTAL STAGE: EXPRESSION IS CONSTANT DURING GROWTH, DECREASES DURING SPORULATION AND IS INDUCED APPROXIMATELY 15 MIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MISCELLANBOUS: CELLS LACKING THE PROTEIN REQUIRE INCREASED LEVELS OF MG(2+) OR CA(2+) FOR GROWTH AND GERMINATION. APPROXIMATELY 50% OF CELLS WITHOUT THE PROTEIN CONTAIN ABNORMAL FYSZ RINGS, SUGGESTING IT IS INVOLVED IN SEPTUM SYNTHESIS; INCREASED LEVELS OF MG(2+) OR CA(2+) ONLY PARTIALLY ELIMINATE THE SEPTATION DEFECTS. SIMILARITY: Contains I fibronectin type III domain. SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Murray T., Popham D.L., Setlow P.;

Malnogaster is caused by a splicing defect affecting selected troponin I isoforms. I.
Mol. Cell. Biol. 13:1433-1439(1993).
I. FUNCTION: Troponin I is the ATPase inhibitory subunit of Troponin in the thin filament regulatory complex. Involved in the development and maintenance of muscle and nervous system. May also be involved in the cytoskeletal apparatus.
                                                                                                                                                                                                                                                                                                          STRAIN=Berkeley; TISSUE=Head; MEDLINES-2436066; PubMed=12537569; MEDLINES-2436066; PubMed=12537569; Stapleton M., Carlson J.W., Brokstein P., Yu C., Champe M., George R.A., Guarin H., Kronmiller B., Pacleb J.M., Park S., Wan K.H., Rubin G.M., Celniker S.E.; "A prosophila full-length CDNA resource."; Genome Biol. 3:RESEARCH0080.1-RESEARCH0080.8

Comment=Excon 3 is either present or absent, excon 6 has 4
mutually exclusive forms (6al, 6a2, 6b1 and 6b2) and C-terminal
exons 9 and 10 are mutually exclusive;
